

Automated Network Request Management **System using ServiceNow**

Project Documentation

Submitted By:

Sandeepthi Sagirisetty

B.Tech – Data Science

Maharaj Vijayaram Gajapathi Raj College of Engineering (Autonomous)

Project Description

A ServiceNow-based automation solution developed to streamline the complete lifecycle of network service requests. The application enables users to submit network requests through the Service Catalog, automates approval workflows, creates and manages network tasks, updates request statuses, and sends email notifications throughout the process using Flow Designer.

Project Objectives

1. To develop an automated Network Request Management System using the ServiceNow platform that streamlines the entire request lifecycle from submission to completion.
2. To simplify the network request submission process through the ServiceNow Service Catalog, providing users with an intuitive and user-friendly interface.
3. To automate the approval workflow using ServiceNow Flow Designer, ensuring that requests are routed efficiently to the appropriate approvers.
4. To automatically create and manage Network Database and Network Task

Chapter 1: Introduction

Introduction

The **Automated Network Request Management System** is a ServiceNow application developed to automate the complete lifecycle of network service requests. The system allows users to submit requests through the Service Catalog, routes them for approvals, creates Network Database and Network Task records automatically, updates request status, and sends email notifications throughout the workflow.

Scope

- Automate network request processing.
- Manage approvals electronically.
- Create and update records automatically.
- Reduce manual effort and improve efficiency.
- Provide real-time request tracking.

Chapter 2: Problem Statement

Problem Statement

Organizations often receive network service requests through manual processes such as emails, phone calls, or spreadsheets. These methods are time-consuming, difficult to track, and prone to delays and errors.

The major challenges include:

- Manual request submission and processing.
- Delay in approval workflows.
- Lack of centralized request tracking.
- Manual creation of network task records.
- Inconsistent status updates.
- Poor communication with requesters.
- Increased administrative effort.
- Difficulty monitoring request progress.

Proposed Solution

The **Automated Network Request Management System** developed using **ServiceNow** automates the complete request lifecycle.

The system:

- Allows users to submit network requests through the Service Catalog.
- Automatically stores request details in the Network Database.
- Sends approval requests to the appropriate approver.
- Creates Network Task records after approval.
- Updates request and task statuses automatically.
- Sends email notifications at every important stage.
- Handles both approval and rejection scenarios.
- Provides complete visibility and tracking of requests.

Chapter 3: System Architecture

System Architecture

The Automated Network Request Management System is designed using the ServiceNow platform to automate the complete lifecycle of a network request. The application integrates the Service Catalog, Flow Designer, custom tables, approvals, and email notifications into a single workflow.

Architecture Overview

The system consists of the following components:

- **Service Catalog** – Users submit network requests.
- **Catalog Variables** – Collect requester and device details.
- **Flow Designer** – Automates approvals, record creation, updates, and notifications.
- **Network Database Table** – Stores all submitted requests.
- **Network Task Table** – Stores tasks created after approval.
- **Approval Engine** – Manages approval and rejection decisions.
- **Email Notifications** – Sends updates to users during the request lifecycle.

Workflow Summary

1. User submits a Network Request.
2. Request details are stored in the Network Database.
3. Approval request is sent to the approver.
4. If approved:
 - Network Database status is updated.
 - Network Task is created.
 - Task approval is initiated.
5. If the Network Task is approved:
 - Both records are updated.
 - Completion email is sent.
6. If any approval is rejected:
 - Status is updated to Rejected.
 - Rejection email is sent to the requester.

SERVICE NOW COMPONENTS USED

S. No.	Component	Purpose	How it is Used in Project
1.	 Catalog Item	Provides a form for users to submit network requests.	Created "Network Request" catalog item in Service Catalog.
2.	 Catalog Variables	Captures information from the user.	Collects requester details, device type, address, and request information.
3.	 Variable Set	Stores reusable variables.	Created "Requester Information" variable set and attached to catalog item.
4.	 Catalog Client Script	Enhances form behavior on client side.	Auto-populates email, name, and phone based on selected user.
5.	 Script Include	Server-side script for data retrieval.	Created "GetUserDetails" Script Include to fetch user information.
6.	 GlideAjax	Enables client-server communication.	Used in client script to call Script Include and retrieve user details.
7.	 Catalog UI Policy	Controls visibility and behavior of fields.	Shows "Other Device Details" field only when "Others" is selected.
8.	 Custom Tables	Stores application specific data.	Created "Network Database" and "Network Task" tables to store requests and tasks.
9.	 Flow Designer	Automates the complete workflow.	Built flows for approvals, record creation, status updates, and email notifications.
10.	 Approvals	Handles approval and rejection process.	Manager and Network Team approvals implemented in Flow.
11.	 Email Notifications	Sends emails at different stages.	Emails sent on submission, approval, rejection, task creation, and completion.
12.	 Access Control Lists (ACLs)	Secures data and controls access.	ACLs created to restrict access based on roles.
13.	 Source Control (GitHub)	Version control and application backup.	Linked ServiceNow application with GitHub repository for version management.

Chapter 5: Project Development Steps

5.1 Application Creation

Objective

Create a scoped ServiceNow application to automate the Network Request Management process.

Steps

1. Navigate to Studio.
2. Click Create Application.
3. Enter the application details.
4. Create the scoped application.
5. Configure the application properties.

5.2 Custom Table Creation

Create the following tables:

- Network Database
- Network Task

Include:

- Table Name
- Label
- Application Scope
- Auto Number Configuration

Table
Network Database

Delete

Update

Delete All Records

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More Info](#)

5.3 Service Catalog Item Creation

Create the Network Request catalog item.

Configure:

- Name
- Category
- Short Description
- Catalog

5.6 Catalog Client Script

Create a Catalog Client Script to auto-populate:

- Email
- Name
- Phone Number

using **GlideAjax**.

5.7 Script Include

Create **GetUserDetails** Script Include.

Purpose:

- Retrieve user details from the **sys_user** table.
- Return data to the Client Script.

5.8 Catalog UI Policies

Create UI Policies to dynamically show or hide fields.

Example:

- Display **Device Details** only when **Others** is selected.

5.9 Flow Designer Configuration

Document your complete Flow Designer implementation.

This section should include:

- Trigger
- Create Network Database Record
- Send Email
- Ask for Approval
- If Approved
- Create Network Task
- Ask for Network Task Approval
- If Network Task Approved
- Update Records

- Completion Email
- Rejection Flow

Chapter 6: ACL and Role Configuration

Overview

To ensure secure access to the application, Role-Based Access Control (RBAC) and Access Control Lists (ACLs) were implemented. These security mechanisms ensure that only authorized users can view, create, update, or manage records within the application.

Role	Description
admin	Full access to the application, configuration, and workflow.
itil	Can view and work on Network Task records.
Approver	Can approve or reject Network Database and Network Task requests.
Requester (End User)	Can submit Network Requests through the Service Catalog.

1 to 4 of 4							

Outcome

The implemented security configuration ensures that only authorized users can perform specific operations, protecting sensitive network request data while maintaining a secure and efficient approval workflow.

- 1. Roles List
- 2. Network Database ACL
- 3. Network Task ACL
- 4. Role assignment (if applicable)

Chapter 7: Testing and Validation

Overview

The Automated Network Request Management System was tested in a ServiceNow Personal Developer Instance (PDI) to verify that all modules function correctly. Both approval and rejection scenarios were successfully validated.

Test Cases

Test Case	Expected Result	Status
Submit Network Request	Request submitted successfully	✔ Pass
Create Network Database Record	Record created	✔ Pass
Manager Approval	Approval request generated	✔ Pass
Create Network Task	Task created after approval	✔ Pass
Network Task Approval	Status updated to Completed	✔ Pass
Reject Request	Status updated to Rejected	✔ Pass
Email Notifications	Emails sent successfully	✔ Pass

7.3 Validation

The following functionalities were verified:

- Network request submission
- Automatic record creation
- Approval workflow
- Rejection workflow
- Status updates
- Email notifications
- End-to-end Flow Designer execution

Chapter 8: Future Enhancements

The following enhancements can be implemented to improve the application in the future:

- Integrate with the CMDB for automatic asset mapping.
- Implement multi-level approval workflows.
- Add SLA management for request tracking.
- Develop interactive dashboards and reports.
- Send SMS or Microsoft Teams notifications.
- Implement AI-based request categorization.
- Enable mobile-friendly request submission.
- Integrate with external network monitoring tools.
- Add audit logs and advanced analytics.
- Support additional network service request types.

Chapter 9: Conclusion

Conclusion

The Automated Network Request Management System using ServiceNow successfully automates the complete lifecycle of network service requests. The application streamlines request submission, approval processing, task creation, status updates, and email notifications through ServiceNow's Flow Designer and Service Catalog.

The project demonstrates the effective use of core ServiceNow features such as Catalog Items, Variables, Client Scripts, Script Includes, UI Policies, Flow Designer, Custom Tables, ACLs, and Email Notifications. It reduces manual effort, improves process efficiency, and ensures accurate tracking of network requests.

Overall, the project provides a secure, scalable, and user-friendly solution that showcases end-to-end workflow automation and practical ServiceNow development skills.
