Problem – Solution Fit

Date	25-06-2026
Team ID	23331A4450
Project Name	Automated Network Request Management in ServiceNow

Solution Fit

The **Automated Network Request Management** solution uses ServiceNow to replace fragmented network-access request handling with a structured, catalog-driven workflow. Employees submit a standardized **Network Access Request** through the Service Catalog, while ServiceNow captures request details, validates and maps catalog variables, creates a centralized Network Request record, routes the request for approval, and coordinates fulfillment by the Network Team.

The solution fits the problem by combining **standardized data capture, automation, approval control, task assignment, status tracking, notifications, and reporting** in one platform. This reduces manual handoffs, improves consistency, and provides a traceable lifecycle from request submission to completion.

Fit Area	How the solution addresses it
Request standardization	The Network Access Request catalog item captures structured request information such as Request Type, Requested For, Access Level, Device Name, and Business Justification.
Data accuracy	Catalog variables, choice lists, mandatory fields, UI logic, and server-side processing reduce incomplete or inconsistent submissions.
Workflow automation	The request lifecycle is automated from catalog submission through Network Request creation, approval, task fulfillment, status updates, and notifications.
Operational visibility	A dedicated Network Request table provides a centralized record for tracking request status and fulfillment information.
Controlled access	ServiceNow application and table-level configuration supports secure access to network request information and administrative management.

Project Design Phase

Proposed Solution Template

Date	25-06-2026
Team ID	23331A4450
Project Name	Automated Network Request Management in ServiceNow

Proposed Solution

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Network-access requests can become fragmented when employees rely on manual communication, inconsistent request details, and separate follow-ups. This can cause delays, incomplete information, weak visibility, and additional effort for the network team.
2.	Idea / Solution description	Develop an Automated Network Request Management application in ServiceNow. Employees submit a Network Access Request through Service Catalog. ServiceNow captures the catalog variables, creates a Network Request record, routes it through approval, creates a fulfillment task for the Network Team after approval, and communicates status to the requester.
3.	Novelty / Uniqueness	The solution combines a custom Network Request data model with a Service Catalog front end and automated workflow. It uses catalog variables, client-side/UI logic, server-side processing, approval routing, task creation, notifications, and centralized status tracking as one end-to-end ServiceNow process.
4.	Social Impact / Customer Satisfaction	Employees get a single, standardized channel for network requests instead of relying on fragmented communication. Clear request fields, automated routing, status visibility, and notifications improve convenience, transparency, and response experience.
5.	Business Model / Operational Value	The project is primarily an internal operational solution. Its value comes from reducing manual coordination, improving request quality, creating auditable workflows, reducing follow-up effort, and helping the network team manage requests in a structured way.
6.	Scalability of the Solution	The ServiceNow design can be extended with additional request types, access levels, approval rules, fulfillment teams, notifications, reports, dashboards, and security controls. The same catalog-and-workflow pattern can support other IT service requests.

Solution Architecture

Date	25-06-2026
Team ID	23331A4450
Project Name	Automated Network Request Management in ServiceNow

Solution Architecture

The Automated Network Request Management application is implemented on ServiceNow using a layered architecture. The **User Interaction Layer** provides the Network Access Request catalog item. The **Business Logic and Automation Layer** validates and maps request information, creates the Network Request record, controls approval, and coordinates fulfillment. The **Data and Fulfillment Layer** stores the request and supports Network Team task execution, status updates, and notifications.

Layer	ServiceNow components / role
User Interaction Layer	Service Catalog → Network Access Request catalog item. Captures Request Type, Requested For, Access Level, Device Name, Business Justification and related request information.
Form & Validation Layer	Catalog variables, choice lists, mandatory fields, Catalog Client Script, and UI logic provide dynamic and controlled request capture. The requester-facing form is kept focused on the information needed for network processing.
Business Logic & Automation Layer	ServiceNow request processing retrieves the Requested Item and catalog variables, maps the submitted values, creates the custom Network Request record, initiates approval, and branches the workflow based on the approval outcome.
Data Layer	The custom Network Request table centralizes Request Type, Requested For, Access Level, Device Name, Business Justification, status, and related fulfillment information. Standard Request / Requested Item records provide the catalog transaction context.
Fulfillment & Communication Layer	After approval, a Catalog Task is assigned to the Network Team for fulfillment. Status changes and notifications keep the requester informed through the lifecycle.

Solution Architecture Diagram

Core workflow: Catalog submission → Request / Requested Item → Get Catalog Variables → Create Network Request → Approval → Approved: Catalog Task for Network Team → Fulfillment and status update; Rejected: status update and requester notification.

Key project configuration: custom Automated Network Request Management application; Network Request table; Network Access Request catalog item; catalog variables and choice lists; UI/client-side logic; server-side data retrieval; approval and

fulfillment automation; notifications; and centralized tracking.
