Project Name	Automated Network Request Management System using ServiceNow
Maximum Marks	2 Marks

Customer Problem Statement:

Organizations often face challenges in managing internal network service requests efficiently. Network requests may involve collecting requester details, device information, address details, and supporting documents, followed by coordination with the appropriate network team.

When these activities are handled manually or across disconnected processes, requests can be delayed, information can be missed, and approval status can be difficult to track. Creating network tasks, updating request records, communicating decisions, and maintaining a clear history can also require significant manual effort.

The absence of a centralized and automated request-management workflow makes it difficult to provide a consistent experience for requesters and network teams. These limitations create a need for an automated, structured, user-friendly, and traceable solution that can manage the complete network request lifecycle.

The proposed Automated Network Request Management System leverages ServiceNow to digitize and automate this workflow. Users submit requests through the Service Catalog, requester information can be populated automatically, records are stored in dedicated Network Database and Network Task tables, and Flow Designer manages approvals, task creation, status updates, rejection handling, and email notifications. This reduces manual intervention and improves visibility, consistency, and processing efficiency.
